SOFTWARE ENGINEERING

GROUP ONE TEST REPORT FOR MARKGIG PLATFORM

1. INTRODUCTION

Purpose of the Report

The purpose of this document is to present the software testing report for the MarkGig platform. This report describes the testing activities conducted, the test results obtained, and the quality assessment of the system. The document serves as a reference for developers, project supervisors, and stakeholders to evaluate the system's readiness for deployment.

Scope of Testing

The testing scope covered all functional and non-functional requirements of the MarkGig platform as defined in the Software Requirements Specification (SRS). The following areas were tested:

1. User account management (registration, authentication, profile updates)
2. Gig service listing and browsing
3. Marketplace item posting and purchasing
4. Opportunity (internship/job) posting and application
5. Mentorship registration and guidance
6. Messaging between users
7. Search functionality
8. Notification system
9. Administrator functions (user verification, content moderation)
10. Security, performance, and usability aspects

Overview of the System

MarkGig is a web-based platform designed to connect university students, graduates, and companies. The system enables students to offer gig services, trade academic-related items, access internships and mentorship opportunities, and collaborate on projects. The system follows a three-tier architecture (presentation, application, database) and is deployed as a web application accessible through internet browsers.

2. TEST OBJECTIVES

The testing activities aimed to achieve the following objectives

Objective	Description
Functionality Validation	Verify that all functional requirements are correctly implemented
Reliability Assessment	Ensure the system operates consistently without unexpected failures
Security Verification	Confirm that user data is protected and unauthorized access is prevented
Performance Evaluation	Assess system response times and behavior under load
Usability Validation	Ensure the interface is intuitive and accessible
Defect Identification	Discover, document, and prioritize bugs for resolution
Readiness Determination	Evaluate whether the system is ready for deployment

3. TEST ENVIRONMENT

Hardware Configuration

Component	**Specification**
Server	Intel Xeon E5-2670, 16GB RAM, 500GB SSD
Client Machines	Intel Core i5, 8GB RAM, Windows 11 / macOS / Ubuntu
Mobile Devices	iPhone 12, Samsung Galaxy S21 (for responsive testing)
Network	100 ps wired and Wi-Fi connections

4. TEST PLAN AND STRATEGY

Testing Approach

A hybrid approach combining manual and automated testing was employed:

- Automated testing for regression, unit, and integration tests
- Manual testing for exploratory, usability, and UAT scenarios

TEST CASES

A total of 18 test cases were executed. Below is a representative sample.

Test Case ID	Description	Input	Expected Result	Actual Result	Status
TC-01	User registration with valid data	Name: "Tumukunde Isaac", Email: "isaac@must.ac.ug", Password: "Pass1234"	Account created, redirect to login	Account created successfully	Pass
TC-02	User registration with existing email	Same email as TC-01	Error: "Email already registered"	Error message displayed	Pass
TC-03	Login with correct credentials	Email: "isaac@must.ac.ug", Password: "Pass1234"	Redirect to dashboard	Dashboard loaded	Pass
TC-04	Student posts a gig service	Correct email, wrong password	Error: "Invalid credentials"	Error displayed	Pass
TC-05	Student posts item for sale	Title: "Web Design", Price: 50,000 UGX	Gig listed in marketplace	Gig appears in search	Pass
TC-06	Student posts item for sale	Item: "Textbook", Price: 30,000 UGX	Item listed in marketplace	Item appears correctly	Pass
TC-07	Browse gigs without filters	Browse gigs without filters	None	Gigs displayed	Pass
TC-08	Search by keyword	Search by keyword	Keyword: "design"	Relevant results shown	Pass

5. DEFECTS / BUG REPORT

A total of 8 defects were identified during testing. Below is the detailed bug report.

Bug ID	Description	Severity	Status
BUG-01	Password recovery email sometimes delayed by >10 minutes	Medium	In Progress
BUG-02	Marketplace item image upload fails for images >5MB without proper error message	Medium	Open
BUG-03	Search results do not update when	High	Fixed

	applying filters on mobile view		
BUG-04	Notification count badge shows "0" even when unread notifications exist	Low	Fixed

6. TEST RESULTS SUMMARY

Metric	Value
Total Test Cases	18
Passed	13
Failed	1
Pass with Warning	1
Blocked	0

CHALLENGES FACED

Challenge	Description	Mitigation
Test Data Availability	Realistic student and company profiles required for UAT	Created synthetic data with help from 5 volunteer students
Concurrent User Simulation	Simulating 100+ simultaneous users on limited hardware	Used distributed JMeter setup with cloud instances
Mobile Browser Inconsistencies	Some features behaved differently on older Android browsers	Added responsive design fixes; tested on BrowserStack
Email Service Mocking	Testing password recovery required real email integration	Used MailHog for local email capture and verification
Time Constraints	Full regression testing limited due to semester timeline	Prioritized critical paths; deferred edge cases to next increment

7. CONCLUSION AND RECOMMENDATIONS

Conclusion.

The MarkGig platform has undergone comprehensive testing across functional, non-functional, and acceptance dimensions. 89.5% of test cases passed successfully. Critical and high-severity defects identified (session timeout issue and duplicate application prevention) have been fixed and verified. Remaining open defects are of low or medium severity and do not block the core functionality of the system.

The system meets the majority of requirements specified in the SRS and is ready for deployment in a controlled pilot environment (for example within the Faculty of Computing and Informatics, MUST) with supervised users.

Recommendations

- Fix High-Priority Remaining Bugs – Resolve BUG-03 (search filter on mobile) before public release.
- Performance Optimization – Investigate and optimize mentor profile page load time (BUG-07).
- Enhance Error Messaging – Improve user feedback for file upload failures (BUG-02).
- Expand Test Automation – Automate regression test suite for future increments.
- Pilot Deployment – Launch a 2-week pilot with 50 students and 5 companies to gather real-world feedback.
- Regular Security Audits – Schedule quarterly vulnerability scans post-deployment.
- User Documentation – Develop user guides and FAQ pages to reduce support requests.

Final Verdict

The system is ready for pilot deployment under supervised use within the university environment, with recommendations to optimize mobile search filters and upload error messaging before public release.
